

## E-SORT DESK CASE STUDY

### SCENARIO

A client who runs a law firm approached us to discuss the possibility of sorting and deduplicating their Medical records, as they found it extremely time-consuming and required an excessive amount of human resources.

### APPROACH

To reduce the time and resources involved in the sorting process, an E-Sorting application was developed to enable easy and quick retrieval of records for litigation processes.

### STRATEGY

Our approach was to make it easier for law firms to retrieve their records. The files are fed as input into the system where they are assigned to appropriate human resources with the E-sort app. These users identify the parameters to code the record for sorting via a user-friendly Interface. Once the coding is done, the system automatically identifies the duplicates and creates deduplicated records for sorting. The system also has options for quality control, which is performed by a separate set of users. Once the Q.C check is done, the system creates the final de duplicated document for the law firm's review.

## RESULTS

This system reduced the time involved in the manual deduplication and management of the sorting processes.

**Reduce Time**

**Easy Sorting**

## CONCLUSION

The clients saw the benefits of the e-sorting application that provided them with ability to quickly retrieve data for their litigation cases, within a click.
