

LITI-CODE SYSTEM CASE STUDY

SCENARIO

A client who was an attorney that tries medical-legal cases approached us to discuss the possibility of automating their Medical Case workflow and organize their cluttered medical files.

APPROACH

We developed a custom application to automate the process of a Medical Case workflow system that has a Customer, Admin, and Production team. The system facilitates the production workflow of the Medical Case where the unorganized medical files are processed and organized to extract the key factors from them.

STRATEGY

Our approach was to correctly unify and code documents to help create accurate databases, saving the time and effort of the end-user to a great extent. We wanted to have a system in place where the clients could easily upload the case and their files. The uploaded files go through various processes and are downloaded and transferred by the admin to the production team. The production team passes the information through various phases such as assignment, extraction, coding, sorting, Q.C check, and delivery. The final file that is ready prepared for delivery is transferred to the Admin and the admin transfers the files to the customer.

RESULTS

The client had various analytical options to search, view, and download files of different cases. They also benefited from the advanced email functionality of the system which sends emails to all the entities throughout the process of production.

Various Options

Feature-Rich

CONCLUSION

The client was able to organize all their documents and files in one place and had various options to view and download reports as per their preference.
